

A Word About Power Catamarans

Our POWER CATAMARANS are hard to beat for speed with comfort. In a rough water chop, the air-cushion between the hulls really smooths out the ride. These boats carry heavier loads than other boats and are very stable, making them ideal family boats for fishing, skiing, or cruising. They turn flat with virtually no banking, and will handle more power than other boats in the same length. For ultimate performance, twin motors are recommended. The cockpit offers exceptional space that you must see to believe. All of our cats are extremely strong and designed for rugged use. Take a close look at the photos and drawings. These are truly unique boats; once you have one you will use it as a standard for ride and room that most other boats will not measure up to.

Details

"Cat" Deflector

A deflector in the tunnel is used on power catamarans with a single motor. The purpose is to divide the water so that it will not hit the part of the lower unit that is not intended to be submerged when running.
